METHOD, SYSTEM, AND PROGRAM FOR CALLING A TARGET OBJECT FROM A CALLER OBJECT

ABSTRACT

Provided are a method, system, and program for calling a target object from a caller object in a first call mode. A program component is invoked in response to the caller object initiating the call to the target object and the program component invokes execution of the call on the target object. The program component monitors the execution of the call on the target object and determines whether the execution of the call on the target object exceeds a threshold. The caller object is notified to cause the caller object to change from the first call mode to a second call mode in handling the call if the execution of the call is determined to exceed the threshold.
